Human comfort and indoor air quality, and their implications for HVAC&R system design are discussed in this chapter. One of the first steps in designing an air-conditioning system is to establish comfort and health criteria for various spaces in the building.

Extracting internal air and replacing it with outside air can increase the need for heating and cooling. This can be reduced by re-circulating a proportion of internal air, or by heat recovery ventilation (HRV) that recovers heat from extract air and uses it to pre-heat incoming fresh air.

Heating, Ventilating, and Air-Conditioning (HVAC) The term HVAC refers to the three disciplines of Heating, Ventilating, and Air-Conditioning. A fourth discipline, Controls, pervades the entire HVAC field. Controls determine how HVAC systems operate to meet the design goals of comfort, safety, and cost-effective operation.

Overview This Design Guide focuses on packaged heating, ventilation and air conditioning (HVAC) systems up to 10 tons per unit—the most common HVAC systems for small commercial buildings in California. These systems are notorious for consuming more energy than is necessary to properly heat, cool, and dehumidify buildings.

The Department for Communities and Local Government (CLG) guide, Improving the energy efficiency of our buildings, A guide to air conditioning inspections for buildings, December 2012 suggests that an air conditioning system is defined as 'a combination of all components required to provide a form of air treatment in which the temperature is controlled, or can be lowered, and includes systems which combine such air treatment with the control of ventilation, humidity and air cleanliness'.
