This is the second volume of a two-volume set that provides a modern account of basic Banach algebra theory including all known results on general Banach $*$ -algebras. The author emphasizes the roles of $*$ -algebra structure and explores the algebraic results which underlie the theory of Banach algebras and $*$ -algebras. Proofs are presented in complete ...

In mathematics, especially functional analysis, a Banach algebra, named after Stefan Banach, is an associative algebra A over the real or complex numbers (or over a non-Archimedean complete normed field) that at the same time is also a Banach space, that is, a normed space that is complete in the metric induced by the norm. The norm is required to satisfy

For a general commutative Banach algebra A , such a definition was only possible under some restrictions on f ; if x_1, \dots, x_k are any elements of A , their joint spectrum is the image in \mathbb{C}^k of the mapping (x_1, x_2, \dots, x_k) where f runs through $X(A)$ (for $k = 1$, it is of course the spectrum of x_1); one then could prove that if B is the algebra of (germs of) functions f holomorphic in a neighbourhood (depending on f) of the joint spectrum of x_1, \dots, x_k , there is a ...

To show this, let \mathfrak{g} denote the vector space direct sum of \mathfrak{l} with the field of scalars \mathfrak{o} . Then elements of \mathfrak{g} are pairs (x, α) , where $x \in \mathfrak{l}$ and $\alpha \in \mathfrak{o}$. With norm defined by the relation $\| (x, \alpha) \| = \|x\| + |\alpha|$, \mathfrak{g} is a normed linear space and is a Banach space if and only if \mathfrak{l} is a Banach space.

Besides providing examples of such Banach algebras, a lot of work has been done in finding applications, that is, in showing that various problems can be successfully resolved in \mathfrak{g} Banach algebras (see the recent papers [2, 5] and references therein).
