Identification of genus and species. The cultivation of diatoms makes it possible, to assign observations to a genus or even species. For this they must be identified. It is a difficult area with an extensive literature that is only mastered by experts. This is the reason why the information on the videos shown here is to be questioned occasionally.

monoraphid diatoms, where one valve pos-sesses a raphe and the other possesses a pseudoraphe. Valve: Diatom cells include an outer, sili-ceous cell wall which is composed of two parts, or valves. Many of the features used to classify diatoms are based on the morphol-ogy of the valves. Each valve has a face and a mantle. Raphe location Yes Yes Yes

Traditionally, diatom identification has been made by expert biologists. They usually use morphometric measures, such as length and width, and other frustule characteristics, like striae density, and they make the identification comparing specimens with previously described diatom in the literature (Blanco, Borrego-Ramos & Olenici, 2017). This task is challenging due to a huge number of diatom species, similarities between species and life cycle related changes in shape and texture.

Introduction Freshwater Diatom Flora of Britain and Ireland is a major project aiming to compile a web-based diatom flora and comprehensive taxonomic review of diatoms from freshwater, brackish and subaerial habitats in the British Isles. The project involves much original research on problematic groups, and description of new species.

Correct identification of diatom taxa is indispensable for diatom-based water quality studies, as well as for biotechnological applications. Biological applications of taxonomy include the identification of taxa from particular specimens. In this regard, identification keys, that use a predetermined set of characters to identify a given individual, are not commonly employed by diatom specialists due to the extreme biological diversity found in this group of microalgae.

FSC Diatoms AIDGAP is an identification guide to diatom genera of benthic habitats in rivers in Britain and Ireland. Identification goes to species level for the most common species. Diatom identification is challenging, but with practice it becomes easier to recognise the main characters.

Diatoms AIDGAP – Field Studies Council

Illustrated keys to the genera of diatoms found in benthic habitats in the UK are provided, along with guides to the identification of the most common species within larger genera. Notes on sampling and laboratory preparation are also provided along with comments on the ecology and environmental preferences for many of the taxa described.
