Any elementary matrix, which we often denote by E , is obtained from applying one row operation to the identity matrix of the same size. For example, the matrix $E = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ is the elementary matrix obtained from switching the two rows. The matrix.

Historically, linear algebra and matrix theory has been developed for solving such systems. In the modern presentation of linear algebra through vector spaces and matrices, many problems may be interpreted in terms of linear systems. For example, let.

$$\begin{aligned} 2x + y - z &= 8 \\ 3x - y + 2z &= 11 \\ 2x + y + 2z &= 3. \end{aligned}$$

Elementary Linear Algebra: A Matrix Approach

In mathematics, an elementary matrix is a matrix which differs from the identity matrix by one single elementary row operation. The elementary matrices generate the general linear group GL_n when R is a field. Left multiplication by an elementary matrix represents elementary row operations, while right multiplication represents elementary column operations. Elementary row operations are used in Gaussian elimination to reduce a matrix to row echelon form. They are also used in Gauss-Jordan elimination.

Take an identity matrix and perform the operation. Get $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 2 & 0 & 1 \end{pmatrix}$. To get the reverse matrix, calculate the inverse.
Or, apply $2R_1 + R_3$ to the identity, getting $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 2 & 0 & 1 \end{pmatrix}$.
