A common way to write a geometric progression is to explicitly write down the first terms. This allows you to calculate any other number in the sequence; for our example, we would write the series as: 1, 2, 4, 8, However, there are more mathematical ways to provide the same information.

A geometric sequence refers to a sequence wherein each of the numbers is the previous number multiplied by a constant value or the common ratio. Let's have an example to illustrate this more clearly. For instance, you're growing root crops. Let's assume that for each root crop you plant, you get 20 root crops during the time of harvest.

The sum of the outer terms of this sequence is 21 and the sum of the inner terms is -6. Find the terms of the sequence. The sum of three consecutive terms of the geometric sequence is 13.

Math Exercises & Math Problems: Geometric Sequence

In order for an infinite geometric series to have a sum, the common ratio r must be between -1 and 1 . Then as n increases, r^n gets closer and closer to 0 . To find the sum of an infinite geometric series having ratios with an absolute value less than one, use the formula, $S = \frac{a}{1 - r}$, where a is the first term and r is the common ratio.

Sum of the First n Terms of a Geometric Sequence

Just as the sum of the terms of an arithmetic sequence is called an arithmetic series, the sum of the terms in a geometric sequence is called a geometric series. Recall that a geometric sequence is a sequence in which the ratio of any two consecutive terms is the common ratio, r . We can write the sum of the first n terms of a geometric series as

Using the Formula for Geometric Series | College Algebra

Number sequences are sets of numbers that follow a pattern or a rule. If the rule is to multiply or divide by a specific number each time, it is called a geometric sequence.

What is a geometric sequence? - BBC Bitesize

A geometric sequence is a sequence in which each term is found by multiplying the preceding term by the same value. Its general term is $a_n = ar^{n-1}$. The value r is called the common ratio. It is found by taking any term in the sequence and dividing it by its preceding term. Example 1.

We call such sequences geometric. The recursive definition for the geometric sequence with initial term a_1 and common ratio r is $a_n = a_{n-1} \cdot r$; $a_1 = a_1$. To get the next term we multiply the previous term by r . We can find the closed formula like we did for the arithmetic progression. Write
