Osteoarthritis is the most common cause of musculoskeletal disability, affecting five million people in Britain. By far the majority of cases are managed in the community. A considerable proportion of patients self-medicate, while others are treated by a GP and the primary health care team.

## **Managing Osteoarthritis in Primary Care | Wiley Online Books**

A considerable proportion of patients self-medicate, whilst others are treated by a GP and the primary health care team. Primary care management involves the use of exercise, physiotherapy, weight loss where necessary, the use of analgesics, particularly non-steroidal anti-inflammatory drugs (NSAIDs) and joint injections.

THE QUESTION OF EXERCISE. The topic of the paper by Williams et al 6 is exercise for people with osteoarthritis. There is little doubt that exercise is beneficial in reducing pain and improving mobility in older patients with chronic joint pain, especially in the knee. 7 But there are challenges for primary care of how to provide advice to the many people with this problem, and how to overcome ...

## **TextBook Managing Osteoarthritis In Primary Care PDF**

Osteoarthritis is a leading cause of pain and disability (1–3). Already a leading chronic health condition in primary care settings (), osteoarthritis will become increasingly prevalent (5–8). Treatment involves a combination of behavioral, pharmacologic, and other clinical therapies (9–11); therefore, both patients and health care providers play key roles in effective management.
