5. Soil Management and Other Applications. The contributions of micromorphology in the field of soil and land management are mainly indirect. By providing a better understanding of processes in the soil, micromorphology helps improving or choosing good management practices. Most direct applications are based on quantitative studies of porosity.

Micropedology is a method of studying undisturbed soil and regolith samples with the aid of microscopic and ultramicroscopic techniques in order to identify the different constituents and to determine their mutual relations, in space and time, as far as the latter is possible. This means that the investigations should be carried out on undisturbed (and mostly naturally oriented) soil samples, in contrast to the other analytical methods used in soil science (e.g., mineralogical, chemical ...
